

Harnessing Biotechnology to Address Today's Needs

Violeta N. Villegas, PhD
 Outstanding Young Scientist 1991
 (Once a Young Scientist)
 Tagbilaran, Bohol
 21 November 2017

Outline

- Introduction to biotechnology
- Why we need biotechnology
- Applications of biotechnology (medicine, industry, agriculture, etc.)
- Genetic principles
- Safety assessment of biotech crops
- One example
- Co-existence of biotech, conventional and organic crops
- Concluding remarks

Should we be afraid of biotechnology?

Nothing in life is to be feared,
it is only to be understood.
Now is the time to understand more
so that we may fear less.

Marie Curie is remembered for her discovery of radium and polonium, and her huge contribution to the fight against cancer.

Now, let us understand what **Biotechnology** is and what it can do.

What is Biotechnology?

Biotechnology (as applied to agriculture) is:

- A technique to transfers gene(s) of interest make better products.
- An option to improve agricultural production
- An extension of traditional plant breeding
- Precision breeding

Traditional Breeding

Genetic engineering (biotech)

New tools in crop improvement

- Molecular markers
- The “omics” (genomics, proteomics, me
- Genetic engineering
- New breeding techniques: gene editing (TALENs, ZFN)

CRISPR : Clustered randomly interspersed short palindromic repeat

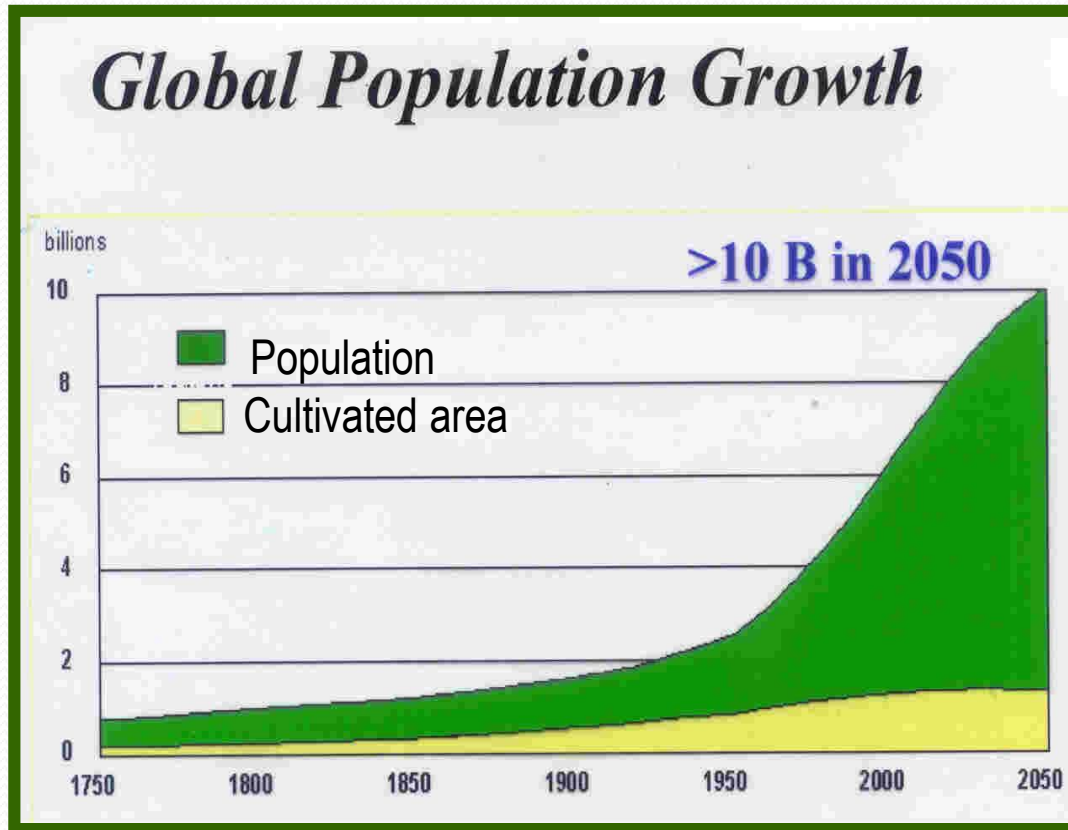

TALENs : Transcription activator-like effector nucleases

ZFN: Zinc finger nucleases

Biotechnology is an OPTION

Why do we need this option?

- Every second, 3 people are born
- Population of 10 B by 2050
- Every 7.67 seconds, 1 ha of productive land is lost

Worsening resource scarcity

Land →

Labor →

Water →

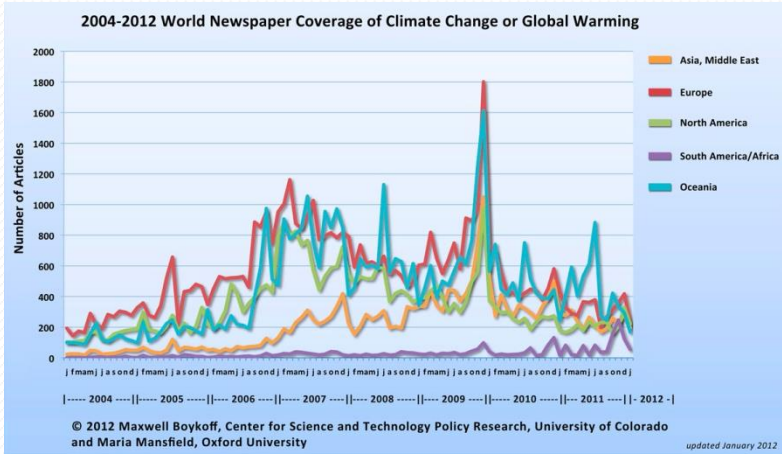

70% more food by 2050, using...

www.uidaho.edu/~media/Files/orgs/Law/law../Trade-wreck-

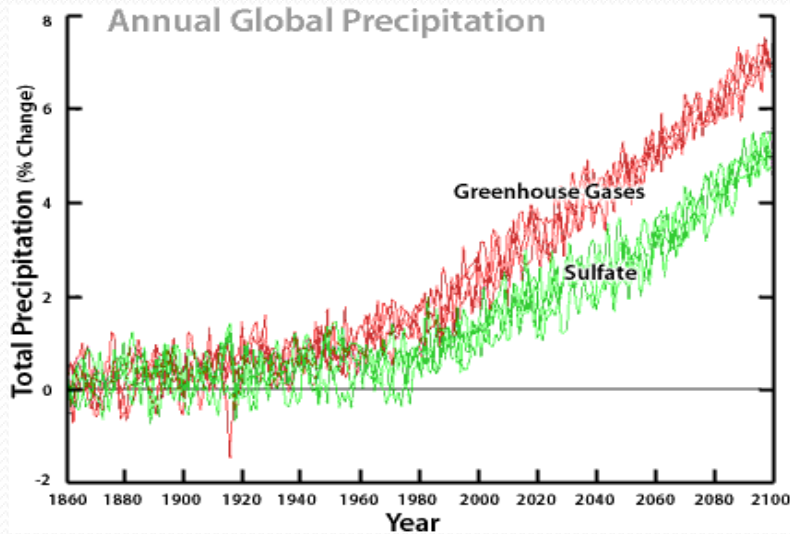

Climate change will negatively affect crop productivity

Global warming, rise in temperature

Sea level rise

Changes in rainfall pattern

Weather disturbances

We need climate-resilient crops

Drought tolerant crops

Crop Distribution by Salt Tolerance

- Sensitive (S) = Dry Beans, Almonds, Walnuts
- Moderately Sensitive (MS) = Tomatoes, Corn, Alfalfa, Melons/Squash, Vineyards
- Moderately Tolerant (MT) = Safflower, Wheat, Sudan
- Tolerant (T) = Asparagus, Oats

Flood tolerant crops

Heat tolerant crops

Water: On the average, it takes 3,000 liters of water per person to produce our daily food (UN World Water Report, 2006)

It takes 3,000 to 5,000 liters of water to produce 1 kg of rice

Biotechnology is NOT NEW

- It is as old as civilization and has helped man prepare various foods and food products
- The range of application of biotechnology is broad:
 - Medicine
 - Industry
 - Agriculture
 - Other examples

Applications of biotechnology

Medicine

- Insulin for diabetic patients
- Factor VIII (blood clotting) for haemophiliac
- Interferon for cancer treatment
- Hepatitis vaccine
- Stem cells

Science and technology

Printing body parts

Making a bit of me

The Economist, 20 Feb 2010, p. 69

Applications of biotechnology

Industry

- Enzymes (chymosin for cheese making, phytase for animals)
- Biofuels (corn amylase)
- Biodegradable plastics
- Plants that absorb pollutants

Genetically Modified Plants: Pollution-Fighting Poplar

- Poplar trees that can clean up contamination sites
- Absorb groundwater pollutants through roots, breaks down into harmless byproducts
- When tested, they removed 91 percent of trichloroethylene (most common contaminant)
- Normal poplar trees only removed 3 %

Applications of biotechnology

Agriculture

- Insect/disease resistant crops (corn, cotton, veg, fruits)
- Herbicide tolerant crops (corn, soybean, cotton, canola)
- Quality traits (fortified food, better shelf-life, healthy oils)
- Resistant to abiotic stresses (drought, flooding, salinity)
- Nutrient use efficient crops

USDA: Nov 2014; FDA: 20Mar2015

USDA, 13 Feb 2015
FDA, 20Mar 2015

APPROVAL REGISTRY (Philippines)

http://biotech.da.gov.ph/Approval_Registry.php

For direct use as food and feed or for processing

Corn

Cotton

Potato

Soybean

Alfalfa

Canola

Sugar beet

- 37 single transformation events
- 35 stacked genes

For propagation (commercial cultivation)

- 6 single transformation events (corn)
- 6 stacked genes (corn)

Corn

Under R & D (Philippines)

Bt eggplant, Delayed ripening papaya,
Bt cotton, Golden Rice, high iron/zinc rice

Promising developments (still in R & D)

<http://mykoreankitchen.com>

Rice with cholesterol-reducing resveratrol
(Nat'l Inst of Crop Science, Korea)

Peanuts with very low allergen levels that have the
potential to eliminate life-threatening peanut allergies

Applications of biotechnology

Others

GM silkworm producing glowing silk
(Japan; gene from coral and jellyfish)

Fast growing GM salmon
(FDA approval in Nov 2015)

Florigene/Suntory's
blue rose (delphinidine
gene from pansy)

Glo Fish (fluorescent gene from coral)

Interesting product in the making (still in R &D)

GM goat that produces spider silk in milk

Uses of spider silk (also called “bio-steel”):

- thin sutures for eye and nerve surgery
- plasters and wound covers
- artificial ligaments and tendons
- textiles for parachutes
- protective clothing and body armor,
- ropes, fishing nets, etc.

GM goat milk containing higher levels of a human antimicrobial protein (lysozyme) was effective in treating diarrhea in young pigs- a finding that displays a potential benefit of genetically modified organisms in promoting human digestive health.

(UC Davis)

Genetic principle

All organisms share the same genetic material and the same biological processes responsible for observed traits

Gene
(DNA)

mRNA
(transcription)

Protein
(translation)

Trait
(Blue rose)

DNA similarities among organisms

Organism	 CHIMP	 MOUSE	 CHICKEN	 FRUIT FLY
Gene Conservation with Humans (%)	99.5	88	75	60

g

(50% with banana, 60% with Strawberry!)

The Safety of Biotech Products is Established Through the Following Approach

Gene(s)

- Source(s)
- Molecular characterization
- Insert / copy number / gene integrity

Protein(s)

- History of safe use and consumption
- Function / specificity / mode of action
- Levels
- Toxicology / allergenicity testing

Crop Characteristics

- Morphology
- Yield

Food / Feed Composition

- Proximate analysis
- Key nutrients
- Key anti-nutrients

GM crops undergo rigid food/feed safety assessment

Food and feed safety

Toxicity, allergenicity, nutritional composition, feed performance are assessed prior to commercialization

APPROVED

Environmental safety assessment of GM crops

- Gene flow/gene transfer
- Effect on non-target organism
- Possible development of weedy species
- Possible development of resistant pests
- Persistence in the environment
- Possible effects on biodiversity

APPROVED

What do they have in common?

**None of these products
would be approved today
if held to the same
standard as biotechnology**

Plant Breeding has along history

THE HISTORY OF GENETIC MODIFICATION IN CROPS

10,000 years ago

Humans begin crop domestication using selective breeding.

1700s

Farmers and scientists begin cross-breeding plants within a species.

1940s and 1950s

Breeders and researchers seek out additional means to introduce genetic variation into the gene pool of plants.

1980s

Researchers develop the more precise and controllable methods of genetic engineering to create plants with desirable traits.

1990s

The first GMOs are introduced to the marketplace.

banana

watermelon

corn

carrot

aubergine / eggplant

cabbage, kale, broccoli, etc.

Genetic diversity is the source of new traits

For example: 127,000+ varieties of rice conserved in IRRI's International Rice Genebank

But, what if the genes are not present in the germplasm?

Example: micronutrient deficiency

Interventions

- Dietary diversification
- Promotion of optimum infant and young child feeding practices (breast-feeding)
- Supplementation
- Food fortification
- Biofortification: a complementary approach

Examples of biofortification of crops

Rice with beta-carotene (also with zinc and iron)

Biofortified cassava

<http://www.spyghana.com>

Vitamin A banana

Biofortified sorghum

Can GM, conventional and organic farming co-exist?

- Co-existence requires mutual respect and tolerance between practitioners of different production systems: no single system has any right to dominate others.
- Co-existence is possible; need to consider:
 - Type of crops: corn and rice don't inter-cross
 - Pollination habit (self-pollinating/cross-pollinating)
 - Distance between crops

Farmers and consumers must be free to choose.

Have a vision

Predict what will be needed tomorrow and work on it NOW!
(because tomorrow will be too late)

APPs: Anticipate, Prepare, Proactive strategies
(and use available technologies)

If I gave people what they wanted,
I would have given them a better horse.
