

Hearing Conservation Program for Noise Exposed Workers

Cesar Anthony P. Yabut, M.D.,FPSO-HNS

CAOHC No. 456483

ENT Specialty Center, Inc.

General Santos City

Nothing to Disclose

Noise and Workplace Safety

The Ear: anatomy
 physiology of hearing
 pathology of NIHL
Acoustic Trauma

Noise: definition
 measurement

Designing a Hearing Conservation Program

Noise survey
Audiometry
Noise Reduction
Hearing Protective Devices
Signage
Awareness Enhancement Activities
Penalties and Incentives
Record keeping and Audit

Noise

Definition: sound of any kind which is either loud or disturbing

Non-Otologic Effects of Noise:

1. Headache
2. Elevated Blood Pressure
3. Fatigue
4. Irritability
5. Digestive Disorders
6. Decreased Immunity

Occupational Noise, Environmental Burden of Disease Series No.9, WHO Geneva 2004
Marisol Concha-Barrientos et.al.

Sound Measurement

Measurement:

decibel: the unit of sound pressure level

(20 times the log to the base 10 of the ratio
of measured sound pressure to the reference
sound pressure w/c is 20uPa)

pascal: the unit of sound pressure

$$0 \text{ dB} = 0.00002 \text{ Pa} = 20\text{uPa}$$

$$20\text{dB} = 0.0002 \text{ Pa} = 200\text{uPa}$$

$$40\text{dB} = 0.002 \text{ Pa} = 2000\text{uPa}$$

$$60\text{dB} = 0.02 \text{ Pa} = 20,000\text{uPa}$$

$$80\text{dB} = 0.2 \text{ Pa} = 200,000\text{uPa}$$

$$100\text{dB} = 2.0 \text{ Pa} = 2,000,000\text{uPa}$$

Noise

With multiple sources of noise, dB is not simply added.

| Difference (dB) | Add to higher (dB) |
|-----------------|--------------------|
| 0 | 3 |
| 1 | 2.6 |
| 2 | 2.2 |
| 6 | 1 |
| 10 | 0.4 |
| 16 | 0.1 |

Definition of Noise Induced Hearing Loss

Transient Threshold Shift: hearing threshold that has become worse temporarily after exposure to loud noise

Permanent Threshold Shift: hearing threshold that does not return to pre-exposure levels

Presbycusis is progressive hearing loss mainly due to the ageing process; this may come early in life in some or late depending on individual susceptibility

Cochlea Pathology Due to Noise

NIHL is caused by a combination of 3 factors:

1. direct mechanical trauma to delicate cells and tissues by the vibration caused by loud noise. The cell membrane and stereocilia are literally torn apart during brief and intense noise (Acoustic Trauma)
2. At lower but sustained exposure levels, metabolic activity of cells is intense resulting in oxidative stress and cell death.
3. Vasoconstriction-induced reduction in cochlear blood flow.

Miller, J. et.al. Noise and Health 5(20);1-17,2003

Once exposure to damaging noise levels is discontinued, further significant progression of hearing loss stops.

Effect of Noise on Hearing Depends on:

Sound intensity

Duration of exposure

Individual susceptibility to Noise
the reason for this is so far unknown

- Theories:
1. Gene expression
 2. Gender
 3. Low HDL level
 4. Nutrition
 5. Underlying Systemic Disease

Treatment of Noise Induced Hearing Loss

Noise Induced Hearing Loss is irreversible or **PERMANENT!**

Treatment modalities are largely experimental.

The **ONLY** way to address NIHL is through avoidance or **PREVENTION.**

Hearing Conservation Program: the objective is to prevent NIHL in the workplace

Designing a Hearing Conservation Program

The Noise Survey:

the objective is to identify high risk areas

Permissible Noise Exposure Levels Occupational Safety and Health Standards (as Amended 1989)

| Duration/Day (hours) | Slow Response (dBA) |
|----------------------|---------------------|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1½ | 102 |
| 1 | 105 |
| ½ | 110 |
| ¼ | 115 |

No exposure in excess of 115 dBA is allowed.
Impact noise shall not exceed 140 dBA peak spl.
Action Level for OSHA is 85dBA

Noise Measurement

The Sound Level Meter

dBA- uses the “A” scale which approximates the sensitivity of the human ear

dBC- uses the “C” scale which is the way a machine would receive sound

OSHA requires the slow meter response

Technique

Calibration

Sound Level Monitoring Data

Q1-2007

Designing a Hearing Conservation Program

Noise Reduction:

Engineering Controls

the choice of equipment

maintenance

replacement

Sound dissemination

soundproofing

soundproofing

Designing a Hearing Conservation Program

Noise exposure reduction:

Administrative Controls:

periodically rotating staff from high risk areas to low risk whenever possible
provides recovery periods for transient threshold shift to return to normal threshold

Designing a Hearing Conservation Program (OSHA compliance)

Audiometry:

Usually on-site using a mobile unit but may be done in the clinic

OSHA Maximum allowable SPL inside test areas:

| | | | | |
|-------|--------|--------|--------|--------|
| 500Hz | 1000Hz | 2000Hz | 4000Hz | 8000Hz |
| 40dB | 40dB | 47dB | 57dB | 62dB |

Screening Method is used using the above frequencies including 3000Hz and 6000Hz

Regular calibration of the Audiometer is important for accuracy.

Audiometrician's technique should be standardized thru a training seminar.

Pre-employment Audiometry: serves as the baseline and should be done after at least 14 hours away from workplace noise and within six months from date of report for work

Annual Audiometry: should be done towards the end of the work shift to identify possible TTS

Re-test Audiometry: if a threshold shift is noted the employee is re-tested within 1 month and after 14 hours rest

If results do not improve a report is made

Exit Audiograms are optional for the company

Annual Audiometry

2000Hz, 3000Hz, 4000Hz: used to compute for standard (significant) threshold shift

Rationale:

1. the low and high frequencies are affected by ambient noise
2. Speech range is covered (300-3000Hz)
3. Area of cochlea corresponding to 4000Hz is most sensitive to excessive noise (dip or notch)

6000Hz required by OSHA but not included in computation

8000Hz is optional

10dB Threshold shift is reportable if the threshold exceeds 25 dB and this would change the baseline

Age-Correction to account for Presbycusis

TABLE 62-2.—"DOSE"/TWA₈
EQUIVALENT

| Dose (percent) | TWA ₈ |
|----------------|------------------|
| 25 | 80 |

Hearing Protective Devices

Noise Reduction Rating
maximum: 30dB

1. Earmuff
25-30 NRR
2. Ear Mold
17 – 25 NRR
3. Ear Plug
17 – 25 NRR
4. Semi-aural Device
17 – 25 NRR

Combination: can only add approx. 5
dB NRR

NIOSH adjustment or derating:
 earmuff- subtract 25% from NRR
 earplug -subtract 50% from NRR

Hearing Protective Devices

The Occlusion Effect:

Occluding and sealing the ear with an earplug or earmuff increases the efficiency of bone conduction below 2000Hz.

This causes the wearer to experience a change in their perceived voice quality and other body-generated sound (chewing, biting, walking, etc.).

Of all the fitting tips devised, listening for the occlusion effect is the most widely applicable, being suited for use with nearly all types of HPD.

Hearing Protective Devices

Should be used at all times in areas with sound levels above 90 dB

Should be available upon request for sound levels between 85-90 dB (action level of OSHA)

Should be worn properly with good fit

Main cause of non-use is discomfort and inability to communicate

Studies have shown that even occasional removal of the device will result in threshold shift

Awareness Enhancement Activities

Objective: to promote the use of hearing protective devices

Identify the target population

Simple, easy to understand

Emphasize the advantage of using the HPD properly and consistently

Encourage interaction to thresh out actual problems regarding the use of HPD

Penalties and Incentives

Objective: to promote the use of Hearing Protective Devices

The staff should be made to understand the reason behind these measures.

Penalties should be reasonable.

Incentives should be encouraging.

Signage

Objective: to promote the use of hearing protective devices in designated areas

Should:

be attractive

have a clear message

be well placed

be adequate in number

Signage

Designing a Hearing Conservation Program

Record Keeping:

Systematic and confidential

Records are kept for a minimum of 5 years from date of separation/retirement

Audit:

To assure quality and effectiveness of the program

Characteristics of a Successful HCP

- Support of management
- Enforcement
- Education
- Motivation
- Comfortable and Effective Hearing Protective Devices

Zohar, D. J. Safety Res. (1980) Vol.2, No. 2, 78-85

Recommendations

1. Review existing government regulations that deal with workplace noise and the prevention of NIHL in the workplace
2. Standardize the design and implementation of Hearing Conservation Programs in the workplace
3. Push for Legislation if necessary on the Implementation of Hearing Conservation Programs in high noise risk workplaces
4. Employ workplace education to increase awareness on the effects of noise on hearing both for employees as well as employers

In Conclusion: A Hearing Conservation Program is a wise investment.

A good Hearing Conservation Program is advantageous to the health, safety and productivity of the worker.

A good program also protects the employer from unscrupulous and spurious claims by employees.

It also promotes harmony and goodwill between employer and employee.

Thank You
