**Reaction to Dr. R.D. Guerrero's
presentation
"The Impacts of Introduced
Freshwater Fishes in the Philippines (1905 – 2013):
A Review and Recommendations"**

Round Table Discussion (RTD) on "The Impacts of Introduced Freshwater Fishes in the Philippines"
National Academy of Science and Technology (NAST) Trader's Hotel (Roxas Blvd., Manila)
May 2014

30

2

Objectives of the RTD:

- Assess the impacts of introduced freshwater fishes in the Philippines
- Review the regulations on the importation of live aquatic species
- **Recommend strategies for the management of invasive alien fishes**
- Enhance public awareness and information on the impacts of introduced freshwater fishes.

Salient points of Dr. Guerrero's paper:

3

- Highlights that not all introduced species had adverse impacts.
- Tilapia et al. have contributed heavily to the aquaculture and fisheries production in our inland waters.
- Aquaculture introductions had less adverse impacts compared to the ornamental introductions.
- Itemizes impacts - attributed to several species
- Presence of regulations on species importations, monitoring and control, adoption of mitigation measures and prevention of possible escapes of potentially invasive species, which need stricter enforcement.

Assess the impacts of introduced freshwater fishes in the Philippines

4

- Tilapia, catfish, gouramis and pangasius have contributed to aquaculture as well as fisheries production.
- Species with **beneficial economic impacts**.
- Emphasizing that NOT all introduced species are bad!
- However.....

Assess the impacts of introduced freshwater fishes in the Philippines

5

Impacts may be economic, sociological or ecological

- Only a few introduced fish species have **on record** provided beneficial economic impacts.
- Of the 30 fishes introduced for aquaculture, only a handful are contributing to food fish production.
- Some of them have now been reported as invasive
- One may ask “Economically beneficial to most or to a handful of businessmen?”
- Prudence in introducing alien species must be exercised.

6

Assess the impacts of introduced freshwater fishes in the Philippines

7

Aquarium and ornamental trade are sources of invasive species in aquatic ecosystems (**Padilla and Williams, 2004**).

- A third of the world's worst aquatic invasive species are aquarium or ornamental species
- Aquarium trade will never be environmentally sustainable unless the consequences of escapees are considered
- Regulations to prevent unwanted species introductions from aquarium and ornamental sources currently lack authority
- A white list of native or safe alternative aquarium and ornamental species will help prevent unwanted introductions

Assess the impacts of introduced freshwater fishes in the Philippines

8

‘introductions for ornamental purposes have been more problematic than those for aquaculture.’

- Aquaculture and the ornamental industry are the major pathways for freshwater fish introductions
- More introductions via aquaculture? – aquaculture introductions have more documentation and are mostly via government
- In reality, there have been more species moved around for the ornamental industry than for aquaculture.
- True for most countries

Assess the impacts of introduced freshwater fishes in the Philippines

9

The “**absence of evidence is not evidence of absence**”.
if we don't know that something exists, it doesn't mean that it doesn't

Impact studies on introduced alien species in the Philippines are lacking, hence we really do not know if impacts exist.

Socio-Economic impacts can easily be assessed but Ecological impacts do have a lag time in showing themselves.

Assess the impacts of introduced freshwater fishes in the Philippines

10

- **Defining and quantifying impacts are difficult**
- Invasion science shifted from impacts of particular species to **cumulative impacts on ecosystems**, revealing that effects of introduction can be many and varied
- e.g. Predatory flatworm invasive to the UK, reduces native earthworms AND affects food supply for birds, soil becomes less porous, increased waterlogging, affects conditions for plants, makes habitat less suitable for moles (Simberloff et al., 2013).

Assess the impacts of introduced freshwater fishes in the Philippines

11

Evaluation of IAS impact should include economic, ecological and sociological (Simberloff et al., 2013)

Japanese tiger prawn – invasive in Mediterranean (extinction of native species of prawn) however welcomed by local fishermen (extra income)

Invasion of pine trees in southern hemisphere, reduces quality of litter, depletes soil biodiversity but support timber industries benefiting local economies.

12

10% rule (Williamson, 1996)

Justifies why risk assessment prior to introduction is essential.

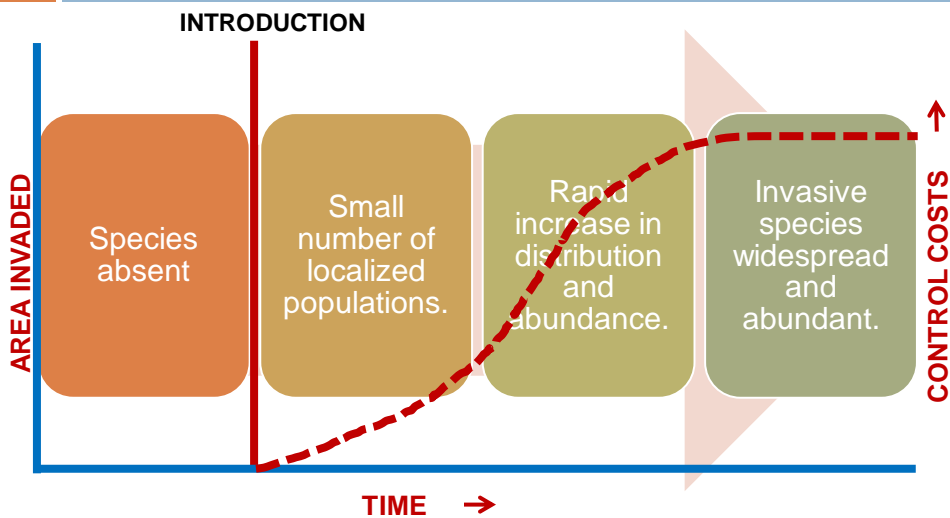

Species Invasion

13

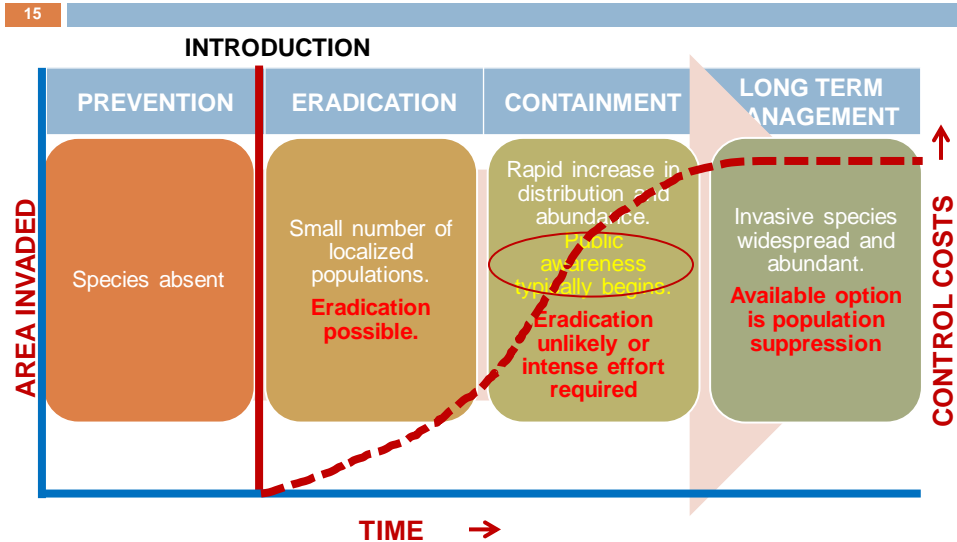

Invasion Curve

14

Invasion Curve

Knifefish

- Invaded Laguna de Bay
- Highly aggressive and carnivorous
- Diet: fishes (>60%), shrimps(~18%) and mollusks (~18%)
- Impacts livelihood of capture fishermen and aquaculture production
- Comprises 40.4% of major catch; daily landing of 10,000 kg
- Economic valuation: for every kg of knifefish produced: losing 7 kg of native fishes at a cost of P1,050.00
- Pathways: escape from ornamental fish farm/aquarium; deliberate release by hobbyists
- Initiative: Gov't buys at P20/kg to help fishermen & for eradication

Chitala sp.
(knifefish)

BFAR, 2014

Review the regulations on the importation of live aquatic species

17

Strictly implement existing regulations on species importations, monitoring and control, adoption of mitigation measures and prevention of possible escapes of potentially invasive species

Be more proactive instead of reactive

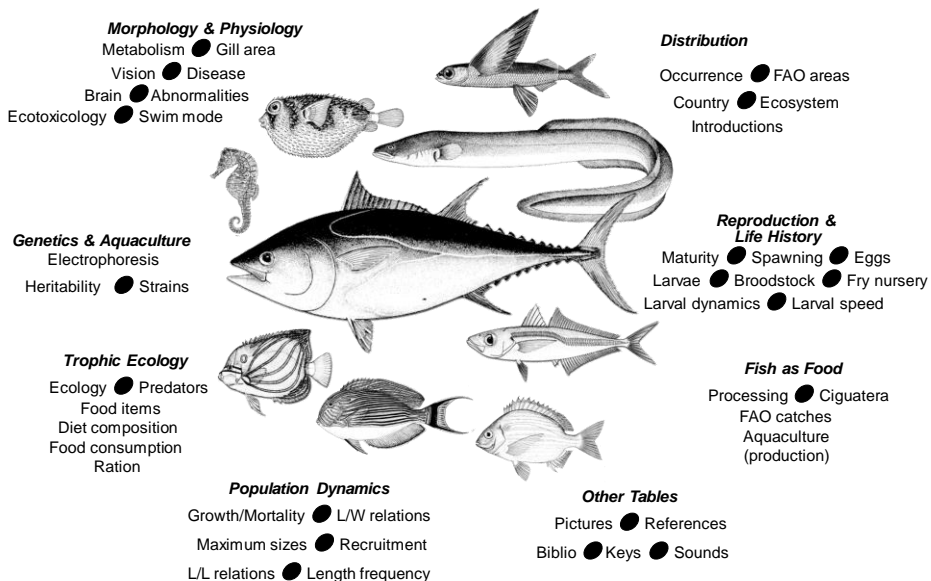

Think about the invasion curve

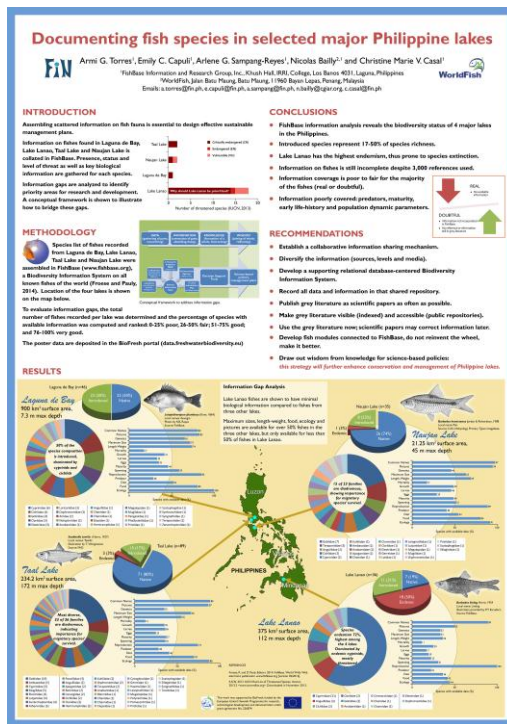

Do risk assessment prior to importation

What is the threshold between economic benefits and adverse ecological impact? What is an acceptable risk?

Ensure immediate response upon establishment of localized populations of IAS.

Information in FishBase

Sieves of the Invasiveness Tool

Aquaculture and Aquarium Fishes Which May Establish Themselves in Philippines [n = 127]

List of commercial aquaculture and aquarium fishes which match the environmental conditions in Philippines, and which have established themselves in at least one other country.

Select: Philippines Percent established: 21%

FishBase name	Species	Family	Aquaculture	Aquarium	Max length (cm)	Temp. (°C)	Climate zone	Productivity	Established in this country	Other
Mozambique tilapia	<i>Oreochromis mossambicus</i>	Cichlidae	commercial	commercial	39 - 35	17 - 30	tropical	Med.	Yes	110
Nile tilapia	<i>Oreochromis niloticus</i>	Cichlidae	commercial	never/rarely	60 - 33	14 - 33	tropical	Med.	Yes	67
Blue tilapia	<i>Oreochromis aureus</i>	Cichlidae	commercial	commercial	46 - 30	8 - 30	tropical	High	Yes	35
Redbreast tilapia	<i>Tilapia rendalli</i>	Cichlidae	commercial	commercial	45 - 28	24 - 28	tropical	Med.	No	28
Green swordtail	<i>Xiphophorus helleri</i>	Poeciliidae	never/rarely	highly commercial	14 - 22	22 - 28	tropical	High	No	28
Redbelly tilapia	<i>Tilapia zillii</i>	Cichlidae	commercial	commercial	40 - 36	11 - 36	tropical	Med.	Yes	24
Longfin tilapia	<i>Oreochromis macrochir</i>	Cichlidae	commercial	never/rarely	43 - 35	18 - 35	tropical	High	No	20
Southern platyfish	<i>Xiphophorus maculatus</i>	Poeciliidae	never/rarely	commercial	4 - 18	18 - 25	tropical	High	No	17
Jaguar gurami	<i>Parachanna managuensis</i>	Cichlidae	commercial	commercial	55 - 25	25 - 36	tropical	Med.	Yes	12
Giant gourami	<i>Osphronemus goramy</i>	Osphronemidae	commercial	commercial	70 - 20	20 - 30	tropical	Med.	Yes	11
Three spot gourami	<i>Trichopodus trichopterus</i>	Osphronemidae	commercial	highly commercial	15 - 28	22 - 28	tropical	High	Yes	9
Peacock cichlid	<i>Cichla ocellaris</i>	Cichlidae	commercial	commercial	74 - 24	24 - 27	tropical	High	No	9
Cachama	<i>Colossoma macropomum</i>	Serranidae	commercial	public aquariums	108 - 28	22 - 28	tropical	Med.	Yes	8
Snakekin gourami	<i>Trichopodus pectoralis</i>	Osphronemidae	commercial	never/rarely	25 - 28	23 - 28	tropical	Med.	Yes	8
Convict cichlid	<i>Ametia nigrofasciata</i>	Cichlidae	never/rarely	highly commercial	10 - 36	10 - 36	tropical	High	Yes	7

Why aquaculture and ornamental sieve

23

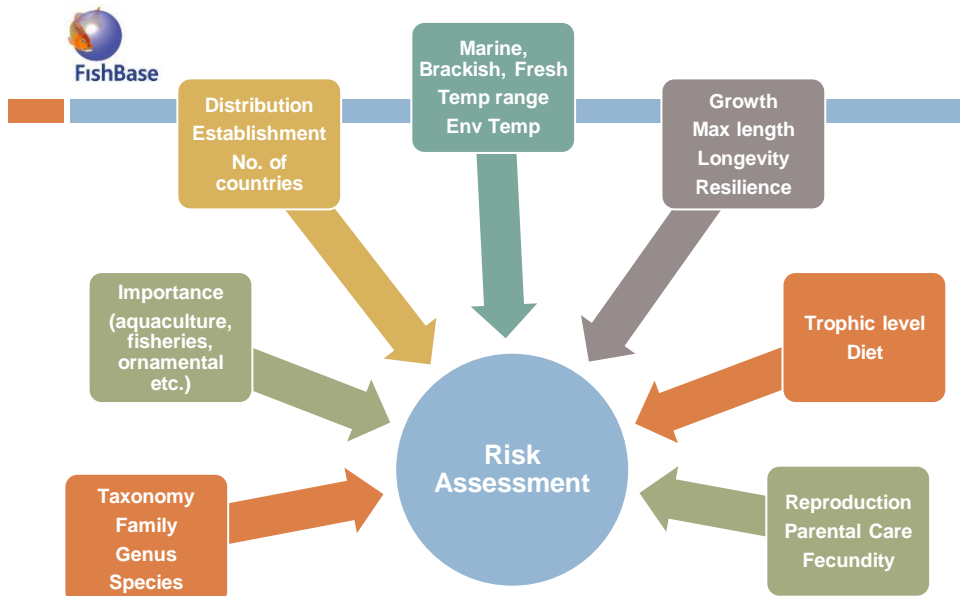

They are always brought in in high numbers, higher chance of establishing in wild

They have been selected for hardiness and suitability to receiving country

They are also the major reasons for introduction

More often than not, they are cultured in natural waters (outdoor fish pens, etc.)

High chance of escaping into the wild in a typhoon-prone country like the Philippines.

Data available for almost 32,700 species

Assess the impacts of introduced freshwater fishes in the Philippines

25

We should do more impact studies on invasive species to have a more holistic view.

What we can safely say right now is that **there is very little evidence of invasive species impacts from introduced aquatic fishes in the Philippines because they have not been well studied.**

Recommend strategies for the management of invasive alien fishes

26

Risk Assessment – prior to importation, introduction to natural waters

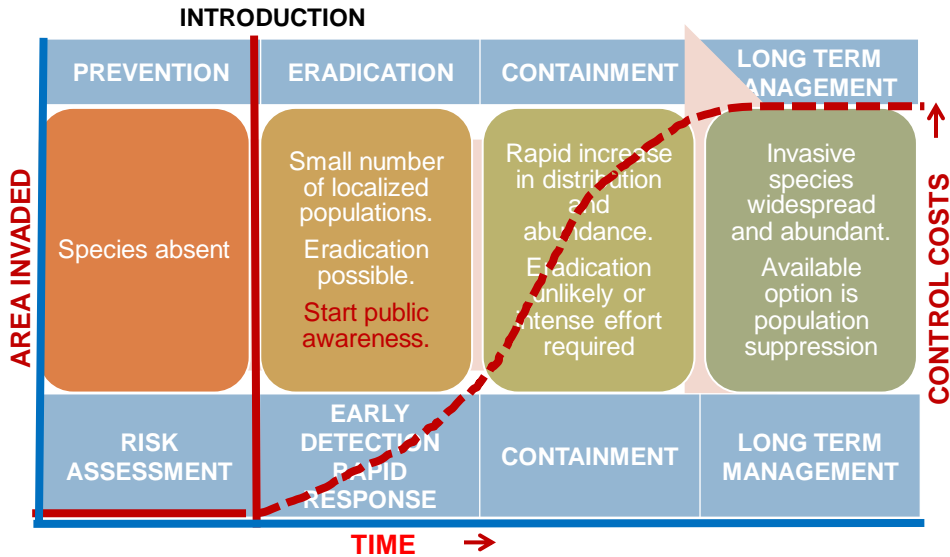

Early Detection – monitoring of areas near aquaculture (food and ornamental species)

Rapid Response – implement a planned response prior to a species' importation and introduction

Invasion Curve

27

Early Detection and Rapid Response

28

Early Detection allows cost-effective removal (Harris and Timmins, 2009) – early extirpation of non-native plants in NZ costs an average 40 times less than later attempts.

Rapid response e.g. prompt removal is ecologically less risky than later interventions (Caut et al, 2009) – a long standing IAS may already have strong interspecific relations within the invaded community.

Eradicating alien species

29

Success of eradication:

- 1) absence of the eradicated species;
- 2) recovery of the ecosystem; and
- 3) absence of surprise effects.

Some eradications have been accompanied by unexpected population explosions of seemingly harmless (or undetected) introduced species, previously suppressed by the eradicated alien species (Courchamp et al., 2011).

These unexpected chain reactions are sometimes referred to as “surprise effects”.

Recommend strategies for the management of invasive alien fishes

30

IAS usually go undetected until the population explodes.

We only learn about them when:

- impacts have been felt,
- it has spread
- it becomes difficult to contain

No regular monitoring of ecosystems

Government agencies can not be everywhere

Recommend strategies for the management of invasive alien fishes

31

Citizen Science can be utilized

Citizen scientists can be tapped to report new entrants to ecosystems

Information can be mapped to show non-native species distribution

Without knowledge on non-native species distribution, effective containment can not happen

Information can contribute to plans for IAS containment

IAS Containment

32

Chances for successful containment of invasive species are relatively good for species in freshwater habitats as fish spread is limited to specific water catchment area.

Enhance public awareness and information on the impacts of introduced freshwater fishes.

33

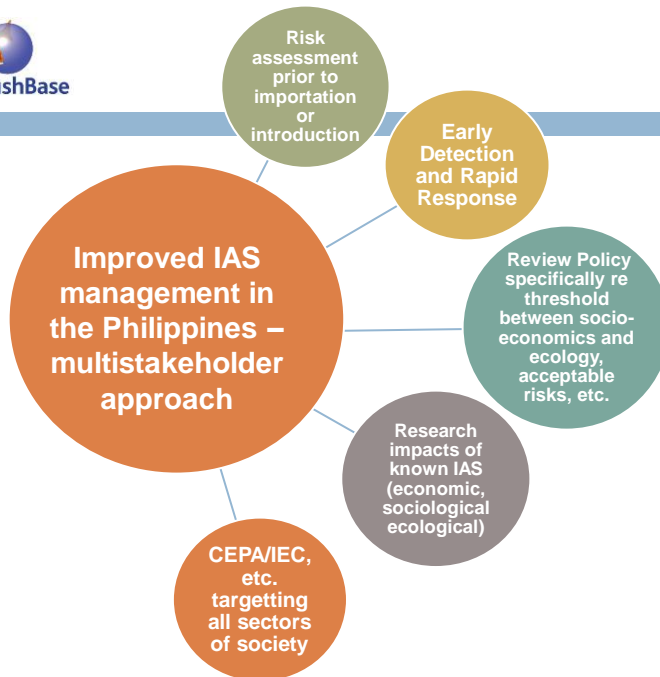

Communication Education and Public Awareness (CEPA) on invasive alien species – in partnership with media and other agencies, newspaper and TV ads, incorporation in school curricula, etc.

Educate responsible pet owners/fish farmers in partnership with the aquaculture and ornamental industry, BFAR, DENR and other groups.

Encourage a responsible aquaculture and ornamental industry – reporting escapes in facilities immediately.

34

Maraming Salamat
